Ribbons: per-domain Δ under a shared domain-label shuffle (n_perm=2000; 2.5–97.5%). Brackets (BV vs each dataset (all pairs in the CSV)): within-domain category bootstrap (n=2000), two-sided, BH-FDR across domains (* / ** / *** = q < .05 / .01 / .001); domains with < 5 categories not tested.
